Indiana Structural Rupture Model (ISRM) v1.0

Status
Public Release – February 2026
Version: 1.0 (Closed and Archived)

Overview

ISRM v1.0 is a structural diagnostic instrument that evaluates the interaction between systemic scale and internal restraint within federated governance systems.

It produces a Structural Pressure (SP) index and classifies jurisdictions into relative structural pressure regimes.

This tool:
- Does not predict specific events
- Does not assign moral valuation
- Does not prescribe intervention
- Does not claim inevitability

It classifies structural configurations.

Core Equation

$$SP = (D \times (1 + P)) / C$$

Where:

$$D = S \times TL \times N$$
$$C = IRD \times M$$

S = Scale composite
IRD = Internal Restraint Density
M = Marriage stability multiplier
P = Fragmentation amplifier (optional)

Reference implementation matches original PDF specification (pages 6–7).

Validation Summary

Validated across:

- U.S. states (1990–2024)
- Mexico (32 states)
- Canada (13 provinces)

Stress tests include:
- Functional form comparison
- Monte Carlo perturbation
- Out-of-sample frozen bounds
- Decade-by-decade IRD decoupling
- Boundary condition mapping

No structural collapse under defined falsifier conditions.

What This Is Not

This is not:
- A crisis predictor
- A collapse forecast model
- A behavioral control instrument
- A policy automation system

It is a structural classifier.
